Our Written World: The journey of "Collective quill"

In the vibrant heart of our school, amidst the rhythmic hum of hallways and the echoes of daily lessons, a beautiful and transformative idea was born: Plume Collectif. This initiative is far more than a mere club or a passing project; it is a living sanctuary where we gather our scattered thoughts, our silent words, and our boundless imagination. We have come to realize that within every student lies a world waiting to be discovered, and "Plume Collectif" serves as the key that unlocks those hidden gates. Here, we firmly believe that writing is the most potent tool we possess to reshape our reality and define the essence of who we truly are.

The Pen as a Confidant and the Paper as a Canvas

In this creative sanctuary, the simplest tools of our trade take on a new, profound life.

Here, the pen becomes our most loyal confidant a silent companion that listens intently to our deepest reflections and helps us translate the whispers of our hearts into tangible ink. It does not judge; it simply flows, guided by the authentic rhythm of our emotions.

As for the paper, we perceive it as a vast canvas where we sketch our dreams and narratives. To a member of "Plume Collectif," a blank page is never a void to be feared, but rather a land of infinite possibilities. It is the sacred ground where a simple sentence can construct a castle, and a single paragraph can ignite a revolution of thought. We do not merely arrange letters; we paint emotions, outlining the figures of who we aspire to become and the vivid worlds we wish to inhabit.

A Window into Our Shared Aspirations

As we gaze toward the future, we realize that writing is far more than words on a page.

It transcends the boundaries of grammar and vocabulary; it is a window into the worlds we dream of together. Writing allows us to transcend our current

circumstances and explore the vast realm of "what could be." Through our collective "Quill," we are documenting the history of our youth, capturing the spirit of our time in this institution, and leaving a lasting legacy for those who will follow in our footsteps.

"Collective Quill" is our open invitation to the world to see through our eyes. It stands as a testament to the fact that when we harmonize our voices, we create a melody far more exquisite than any solo performance. We are the architects of our own journey, and today, we invite you to look through our window and dream alongside us.

Every Voice Holds Value, Every Letter Carries a Message

A core pillar of our collective is the unwavering belief that every student possesses a

unique voice. In the frantic rush of academic life, it is easy to feel like just another face

in the crowd. However, within these pages, every individual is the protagonist of their

own story. We understand that a diversity of thought is what makes our school community truly vibrant. Whether it is a poem about a solitary rainy afternoon, an insightful essay on a scientific breakthrough, or a short story set in a distant galaxy,

every letter carries a profound message.

At "Plume Collectif," we write to express ourselves, not merely to impress. We write to

create something out of nothing, and most importantly, to share moments of humanity with everyone. While writing is often a solitary act, bringing our words together in this magazine transforms it into a collective celebration. We share our laughter, our struggles, and our quiet victories, building a bridge of empathy that

connects students, teachers, and readers alike.

Introduction to Ibno Mandor

Our high school, Ibno Mandour, is a place where students come to learn, grow, and improve their skills. It is not just a normal school like the others; it is a safe space where students can feel comfortable, express themselves, and discover their talents. For me, this school is more than just a place where we attend classes every day. It is a place full of opportunities, experiences, and beautiful memories. One of the things that makes our high school special is the variety of clubs that it offers. We have many clubs where students can practice different interests such as robotics, English, writing, public speaking, and acting. These clubs give students the chance to develop their abilities, gain self-confidence, and work on the

things they truly enjoy. They also help students become more active and creative. Instead of only focusing on lessons, students can also spend time doing activities that match their passions and personalities.

Another thing that makes our school unique is that we organize a Cultural Week every year.

This event is one of the most exciting moments of the school year. During this week, students prepare stands about different cultures and present them in front of visitors. Through these stands, we welcome people and introduce them to traditions, clothes, food, music, and many other aspects of different countries. It is a very interesting and enjoyable experience because it allows students to learn about the world while also sharing knowledge with others.

During Cultural Week, students can also present their achievements and talents. For example, some students present books or novels they have written, while others show theatrical pieces they created. We also have talented and intelligent students who present their robots and scientific projects. This makes the event even more inspiring because it shows how creative and hardworking the students of Ibno Mandour are. It is a moment when everyone can be proud of what they have done.

Our school also has several classrooms, science labs, and sports areas that help students learn in a better environment. These spaces are important because they make studying easier and more effective. In my high school, we also have many fields of study such as mathematics, physics, and economics. This gives students with different interests the opportunity to study what they love and what they are really into. It helps each student choose the path that suits their goals and dreams.

What I like most about my high school is that you can find friends with the same interests as yours, which makes you feel comfortable and happy. This is one of the reasons why coming to school every morning feels lighter. You know that you are going to meet people who understand you and share your passions.

As an Ibn Mandour student, I would like each one of you to have the chance to live this experience. My high school is not only a place of education, but also a place of growth, creativity, and connection. I am proud to be part of it.

03 Personality of the issue

In this issue, we chose to highlight our math teacher Mr. Khairi, whose teaching style truly stands out unlike traditional methods. he creates an interactive and engaging classroom where his students feel comfortable participating and asking questions, the way he explains is both clear and enjoyable, which makes the most challenging concepts easier to understand. what makes mr Khairi more remarkable is his personality he is a supportive and an energetic person, and very passionate about his job and that energy motivates his students to stay focused and give their best

Even students who usually struggle with math or dislike it find themselves more involved in his lessons. he has a unique ability to make the subject feel less intimidating and more approachable wich changes the learning experience

Personally his impact has been significant last year, I struggled a lot with math and had a very low grad of 06/20 this year thanks to his teaching and encouragement I improved to 15/20, this progress reflects not only better understanding, but also increased my confidence

If one word had to describe him, it would be something between inspiring, energetic and motivating a teacher who makes a difference. Even though he is not directly involved in this magazine, his positive influence on students makes him a perfect choice for “Person of the issue”

04 The world of living beings

Human Interaction with Other Living Beings

Human Interaction with Other Living Beings In everyday life, humans are constantly connected to other living creatures. We depend on plants for oxygen, food, and natural resources. Agriculture is a clear example of this relationship, where humans grow crops and rely on animals like bees to pollinate them. Without these interactions, food production would not be possible.

Pets such as dogs and cats are also part of human life. They provide comfort, companionship, and emotional support. On the other hand, some living creatures, like mosquitoes or flies, can cause discomfort or spread diseases. These different interactions show that the relationship between humans and other living beings can be both positive and negative, but it is always important.

LIVING CREATURES IN OUR DAILY ENVIRONMENT

When people think about living creatures, they often imagine wild forests or distant oceans. However, life exists all around us, even in cities and neighborhoods. Humans share their daily environment with many other living beings such as birds, insects, plants, and small animals. For example, pigeons fly between buildings, cats roam the streets, and ants live in small colonies on sidewalks.

These living creatures have adapted to urban life in remarkable ways. Birds may build their nests on rooftops instead of trees, while some animals survive by finding food in human waste. Plants grow in parks, gardens, and even between cracks in the pavement. This shows that nature is not separate from us; it exists beside us and adapts to our way of life.

CHALLENGES AND SIMPLE SOLUTIONS

The world of living creatures today faces many real-life challenges, especially due to human activities. Pollution from cars, factories, and waste affects air, water, and soil, harming both animals and plants. In addition, the expansion of cities leads to the destruction of natural habitats, forcing many species to disappear.

Despite these problems, individuals can take simple actions to help protect living creatures. Reducing waste, recycling, and limiting the use of plastic can make a big difference. Planting trees and protecting green spaces also support life in urban areas. By being more responsible in our daily actions, we can help create a healthier environment.

In conclusion, living creatures are an essential part of our daily lives. Humans are not separate from nature but are deeply connected to it. By understanding this connection and taking small steps, we can help protect the world of living beings for future generations.

Did you know?

The world is full of surprising facts so strange, delightful, or unexpected that they seem almost made up. Here are a few that might just change the way you see everyday life.

Did you know that bananas are technically berries, but strawberries are not? Botanically, a berry develops from a single ovary and must have seeds embedded inside the flesh. By that definition, bananas, cucumbers, and even watermelons qualify as berries, while strawberries with their seeds on the outside belong to a different category altogether.

Did you know that octopuses have three hearts? Two pump blood to the gills, while the third circulates it to the rest of the body. Even more astonishing, when an octopus swims, the heart that delivers blood to the body actually stops beating. That's why these intelligent creatures prefer crawling to swimming—it's simply less exhausting.

Did you know that a day on Venus is longer than a year on Venus? The planet takes about 243 Earth days to rotate once on its axis, but only about 225 Earth days to complete one orbit around the Sun. If you lived there, you would experience fewer birthdays than sunrises.

Did you know that the shortest war in history lasted only 38 minutes? The Anglo-Zanzibar War of 1896 broke out when the British Empire issued an ultimatum to a newly installed sultan. When he refused to step down, British warships opened fire. The sultan's palace surrendered less than 40 minutes later, making the conflict remarkably brief.

Did you know that honey never spoils? Archaeologists have found pots of honey in ancient Egyptian tombs that are over 3,000 years old, and still perfectly edible. Honey's low water content, high acidity, and natural enzymes create an environment where bacteria and microorganisms simply cannot survive.

Did you know that there is a species of jellyfish that is effectively immortal? *Turritopsis dohrnii*, often called the “immortal jellyfish,” can revert to its juvenile polyp stage after reaching maturity, essentially restarting its life cycle. Unless eaten or killed by disease, it can theoretically live forever.

Did you know that the Eiffel Tower grows in summer? When iron heats up, it expands. During hot weather, the tower's metal structure can grow by as much as six inches. Engineers designed it with this expansion in mind, ensuring the structure remains safe across all seasons.

Did you know that your stomach gets a new lining every few days? If it didn't, the powerful hydrochloric acid used to digest food would digest your stomach itself. The rapid replacement of the stomach lining is one of the body's most remarkable acts of self-preservation.

Did you know that Scotland's national animal is the unicorn? Chosen for its symbolism of purity, strength, and independence, the unicorn has appeared on Scottish royal coats of arms since the 12th century. In Celtic mythology, unicorns were believed to be untamable creature a fitting emblem for a nation that prized its freedom.

From the natural world to human history, the ordinary is often far stranger than fiction. The next time you bite into a banana, glance at the night sky, or walk past a honey jar, remember: there's always more than meets the eye.

Diverse cultural and scientific information

The world reveals its wonders in unexpected places: sometimes in ancient traditions, sometimes in the quiet laws of nature. Here are three stories that bridge culture and science, each offering a glimpse into how deeply human life is intertwined with the natural world.

The Mongolian Ger: A Portable Ecosystem

The traditional Mongolian dwelling, known as the ger (or yurt), is not merely a tent but a masterwork of sustainable engineering, perfectly adapted to the harsh steppe climate. For over 3,000 years, nomadic herders across Central Asia have relied on the ger as a portable home that can be assembled or dismantled in under an hour. Its structure is deceptively simple: a collapsible wooden lattice wall (khana), a crown (toono) at

the top, and radiating poles (uni) that form the roof. But the genius lies in the details. The felt covering, made from compressed sheep's wool, provides exceptional insulation, keeping the interior warm in winter temperatures that can plunge to -40°C and cool during summer heat.

Wool's natural breathability also wicks moisture away, preventing condensation inside.

From a scientific perspective, the ger is a passive climate control system. The toono serves as both a smoke vent for the stove and a natural air regulator, creating a gentle convection current that circulates fresh air without drafts. Modern architects are now studying ger design for sustainable housing solutions, recognizing that this ancient innovation offers lessons in energy efficiency, portability, and harmony with the environment.

The Baobab: Africa's Tree of Life

The baobab tree (*Adansonia*) is not only one of the oldest living organisms on Earth but also a cornerstone of African culture, medicine, and nutrition.

Baobabs can live for over 2,000 years, and their enormous trunks, often exceeding 30 meters in circumference, store thousands of liters of water, allowing them to survive extreme drought. Local communities have long relied on this natural reservoir, carving hollows into living trees to collect rainwater during dry seasons. But the baobab's cultural significance runs deeper. Known as the "Tree of Life," virtually every part is used: the leaves are eaten as a nutrient-rich vegetable; the bark is woven into rope and cloth; and the fruit, containing a powdery pulp, is packed with vitamin C (six times more than oranges), calcium, and antioxidants.

Scientifically, the baobab has drawn renewed interest as a “superfruit.” Its pulp is now exported globally as a natural health supplement, while researchers study its remarkable longevity and resilience. Recent genomic studies suggest that baobabs have evolved unique DNA repair mechanisms that may hold clues for combating aging-related cellular damage. In African oral traditions, the baobab is often called the “upside-down tree” because its bare branches resemble roots reaching for the sky, a fitting metaphor for a species that reverses our expectations of what a tree can be.

The Khipu: Knotted Records of the Andes

The Inca civilization developed a sophisticated information system using only strings and knots, a technology so effective that scholars today debate whether it functioned as a form of writing. The khipu (or quipu) consists of a primary cord from which hang numerous pendant strings, each tied with complex knots. Used by the Inca from roughly 1400 to 1532 CE, khipus served as administrative tools for recording census data, tax obligations, and agricultural yields. But recent discoveries suggest their purpose may have been far broader. Some colonial-era accounts describe khipus as “talking knots” used to record histories, poetry, and even legal narratives.

From a scientific standpoint, khipus represent a remarkable example of binary-like encoding. Knot types (figure-eight, long, etc.), their positions along the string, color variations, and even the direction of twist all convey meaning. Researchers at Harvard’s Khipu Database Project have analyzed hundreds of specimens, revealing patterns that correlate with census hierarchies. Meanwhile, linguistic anthropologists argue that certain khipus may contain non-numerical, narrative information, essentially a three-dimensional semiotic system. In 2005, a rural Peruvian community was found to still use a modified khipu system for livestock records, proving that this thousand-year-old technology never fully vanished.

From the steppes of Mongolia to the savannas of Africa and the highlands of the Andes, these cultural and scientific treasures remind us that innovation is not always modern, and that the natural world and human ingenuity have always been partners

07 Unforgettable rules

Nobody Actually Has it Figured Out

Everyone keeps asking what you want to do with your life. Teachers, relatives, random adults at family gatherings who somehow think that's a perfectly normal thing to ask someone who still forgets to eat breakfast most mornings.

And the worst part? You feel like you're supposed to have an answer. A real one. Something confident and specific that makes them nod approvingly and move on. So you say something vague and watch them look slightly disappointed, and you carry that feeling home like you've already failed at something.

Here's what nobody tells you most people who have impressive, fulfilling careers today had absolutely no idea at that age. The person who confidently announced at 16 that they wanted to be a doctor either got lucky that it worked out, or spent years quietly changing direction without making a public announcement about it. Both are completely valid. Neither makes a better story than the other.

The pressure to have everything mapped out before you're old enough to vote is one of the most stressful and unnecessary things about being a teenager. Your brain is still developing scientifically, neurologically, actually still growing. Your interests are still shifting. Things you're passionate about right now might bore you in two years, and something you haven't discovered yet might become everything. The version of you that exists at twenty will want things the current you hasn't even imagined yet. That's something to look forward to not to feel bad about.

So have rough ideas, sure. Stay curious about everything. Work hard at what's in front of you right now. But stop beating yourself up for not having a five year plan when you've barely lived five years of real independence. The adults pressuring you for answers figured it out gradually, messily, and much later than they'd like to admit. You're not behind. You're just at the beginning which is exactly where you're supposed to be.

On Comparing Yourself to Everyone Around You

Social media made comparison faster, easier, and completely inescapable. Someone is always doing better, looking better, achieving more at least from the outside.

But here's what the highlight reel never shows. The person whose grades you envy cried over that same subject two weeks ago. The one who looks effortlessly confident has a whole internal dialogue you'd never guess from their Instagram. Everyone is fighting something invisible. Everyone.

Comparison also has this sneaky way of making you compete in races you never actually signed up for. Suddenly you feel behind on a timeline that was never yours to begin with someone else's definition of success quietly became the standard you're measuring yourself against without even noticing.

The only comparison worth making is between who you were last month and who you are now. That's the only race where winning actually means something to your life.

Rules of Procrastination, Written by Someone Guilty of All of Them

You know the feeling. The assignment has been sitting in your bag for four days. You're aware of it constantly while eating, sleeping, or watching videos it lives rent free in the back of your mind, making everything else slightly less enjoyable. And yet. You don't do it.

Procrastination can be seen as laziness from the outside view but it isn't. That's the first thing to understand. Lazy people don't feel guilty. Procrastinators feel guilty the entire time they're just paralyzed by some combination of anxiety, perfectionism, and the very specific pain of starting something hard from nothing.

The task feels enormous in your head. So you avoid it. And the longer you avoid it, the more enormous it becomes. That's the trap that avoidance makes anxiety grow, which makes avoidance more tempting, which makes the anxiety grow more. You're not procrastinating because you're bad at time management. You're procrastinating because the thing feels scary and starting feels worse than waiting.

The only way out is embarrassingly simple and genuinely difficult ; you just have to start. You don't have to do it perfectly nor finish it. Just open that book, write one sentence, read one page. The starting is the hardest part. Everything after that has its own momentum.

Also, stop waiting to feel motivated. Motivation follows action it almost never precedes it. Nobody wakes up excited to write an essay. You sit down, you begin, and somewhere in the middle of it you find a rhythm. That rhythm was never going to arrive while you were lying down watching videos convincing yourself you'd start in twenty minutes.

Your future self is not a different, more disciplined, more energetic version of you. They're you, just later, with less time and the same amount of reluctance. Stop handing them your problems.

08

Proverbs and sayings

There are some quotes we hear so often that we stop paying attention to them. They become part of our

speech, but when you take one and actually think about it, it can feel more serious than it first seems.

“Knowledge is power” by Francis Bacon.

At school, this is probably one of the most repeated quotes which you might even find painted on the walls. Teachers use it when students don't want to study or when a subject feels useless. And honestly, in those moments, it doesn't sound convincing. It just feels like another way to push us to work. But outside of school, it makes more sense. Knowing things changes the way you react. When you understand a situation, you're less likely to feel lost or to follow others without thinking. Even in simple situations, like answering in class, understanding gives you a kind of ease and confidence. You hesitate less. So maybe the “power” here isn't something big or impressive. It's quieter than that. It's more about control, or confidence. And that's something people don't always notice immediately. Also, knowledge isn't limited to school subjects. It can be about people, situations, or even yourself. And that kind of knowledge matters just as much in everyday life.

“Be the change you wish to see in the world” by Mahatma Gandhi.

It's the one I really appreciate. It's a quote that comes up a lot when people complain. At school, for example, students often criticize others for being disrespectful or say the environment isn't good. But sometimes, they act the same way. So the idea is simple: start with yourself. Don't wait for others to change first. It's easy to understand, but much harder to actually apply. Some people think

this idea is unrealistic, because one person can't change everything. And that's true. But it can still change your own behavior, and sometimes that affects people around you. For example, if one student starts taking things seriously, participates more, or shows respect, it can influence the class little by little. Not always, but enough to make a difference.

There is also the proverb “Where there is a will, there is a way.”

Unlike the previous quotes, this one doesn't have a clear single author. It has been used for a long time in different cultures. It usually appears when someone is struggling, like before exams or when they feel like giving up. The message is that if you really want something, you'll find a solution.

Not everyone fully agrees with it. Sometimes you try, and it still doesn't work. But even then, it pushes you to keep going instead of stopping too early. And in many cases, that persistence already changes something.

For example, a student who struggles with maths might improve simply by doing more exercises and not giving up too quickly. They may not become the best, but they still make progress. And that in itself already matters.

In general, these quotes and proverbs aren't just things to memorize or decorate our speech with. We hear

them in real situation, at school, at home, or in everyday conversations because, as Moroccans, they are

part of our culture, and we grew up hearing them from our parents and grandparents.

We don't always follow them, and we don't always agree with them. But they stay because they are simple

and useful when you want to express an idea quickly.

And sometimes, their meaning doesn't hit immediately. You can hear the same quote many times without

caring, and then one day, in a specific moment, it suddenly makes sense.

So maybe what makes these proverbs important isn't that they are always true, but that they become

meaningful at certain moments. And that's probably why people keep using them.

09 Puzzles

Crossword

Across

- 1. a place where you buy groceries
- 3. what water does when it is heated
- 6. a red fruit
- 7. the ketchup
- 11. something you can add to your drink
- 13. components used to make a food
- 15. the cake

- 17. a common drink at Starbucks
- 18. tasty; appetizing
- 19. a drink that can be sweet or iced
- 20. breakfast

Down

- 2. someone who only eats vegetables
- 4. the water
- 5. the strawberry
- 8. the fruit

- 9. a bitter taste in some candy
- 10. the ice cream
- 12. the cheese
- 14. a green, leafy vegetable
- 16. used to make lemonade

10 Ibno Mandor activities

Collective Quill

From the very first session, we began working on the club's main project: participating in the short story competition. The first step was to choose the genre of the story. Would it be a realistic narrative, a fantasy story, or one carrying a social message? This choice was made through a vote among club members, giving everyone the feeling of contributing to the project. Writing was not just an individual task, but also a collective effort where each pair created and imagined in their own way. After choosing the genre, we gradually started working on the story. We do not write the entire short story at once. We begin with the basics, especially the initial situation. During one activity, a student would propose an opening situation based on a chosen theme. The others would then discuss the idea: was it interesting? clear for the reader? capable of capturing attention from the very first lines? This method taught us that a good story does not depend only on the idea, but also on how it is presented. As the sessions went on, we progressed in structuring the story. At each meeting, we thought about what would come next: the development of the characters, the following events, and the message to convey. What makes the writing club special is its atmosphere. It is not a place that is strict and silent all the time. There are, of course, moments of concentration during writing, but also moments of relaxation where we exchange ideas or tell a few jokes to stay motivated. Within pairs, mistakes are not a problem. They are a step in the learning process. We can write a paragraph, revise it several times, or replace one idea with another more relevant one. The club also teaches us to accept constructive criticism. At first, it can be difficult to hear comments about your work, but over time you understand that they help you improve. Beyond writing, the club teaches us patience, thinking before writing, and confidence in our imagination. This club is therefore not only a place for learning literature, but a space where ideas become texts and where a simple thought can turn into a story shared with the whole school.

Speak up

At IBN MANDOUR High School, the Speak Up Club, founded by Ahlam Khalid and Aya, provides students with a fun and supportive space to practice English. Open to anyone with an A2 level or higher, the club organizes debates, public speaking sessions, and interactive games, with plans for dramas and competitions in the future. Unlike regular classes, it focuses on speaking and producing content rather than just reading. Through these activities, students build confidence, overcome shyness, and improve their communication skills effectively.

Innovators club

Between innovation, team spirit, and a passion for technology, the robotics club stands out as a dynamic space where students develop their skills and push their limits. More and more students are joining the club, attracted by technical challenges and the opportunity to participate in prestigious competitions. At the heart of the club's activities, competitions play an essential role. They represent both moments of learning and self-improvement. Participants must face time constraints, solve complex technical problems, and work under pressure. These experiences teach them the importance of anticipation, organization, and consistent work in order to avoid last-minute issues. The club has notably participated in several major competitions, such as Course en Cours (CeC) and the World Robot Olympiad (WRO). During these events, some members stood out for their commitment. For example, Abderrahmane Seiad and Achraf Essouli worked tirelessly to complete their project, even staying up several nights in a row to be ready for the national finals. Their experience perfectly illustrates the determination and sense of sacrifice required to succeed in this field. The club also emphasizes learning through failure. Defeats are not seen as obstacles, but as opportunities to improve. Members analyze their mistakes, identify their weaknesses, and continuously improve their projects. This approach allows them to strengthen their skills and build their self-confidence. Another key element of the club is teamwork. The success of a project does not depend solely on technical skills, but also on the ability of members to collaborate effectively. Task distribution, communication, and mutual support are essential to successfully complete projects. The club thus promotes an environment where everyone can learn from others and contribute according to their abilities. Finally, the robotics club stands out for its discipline and motivation. Members must demonstrate rigor, patience, and commitment in order to progress. Thanks to this mindset, the club not only trains skilled technicians, but also responsible, creative students who are ready to take on the challenges of the future.
